

Root Canal Therapy

Robert Gammal BDS

“...it's the story of how a cast of millions
become entrenched inside
the structure of teeth
and end up causing
the largest number of diseases
ever traced to a single source.”

Dr George Meinig

“Root canal treatments and restorations
including fillings, crowns and bridges,
use chemicals known
to the State of California
to cause cancer.”

Superior Court, California 2003

A Root Canal Therapy is the procedure of trying to remove dead, infected tissue from the inside of a tooth. It is then supposedly cleaned, sterilized and filled. The dental profession calls this 'saving' a tooth.

NONE of the principles and aims of root canal therapy are achievable.

Published scientific papers clearly demonstrate that:

- It is NOT possible to remove all dead and decaying tissue
- from the inside of a tooth
- It is NOT possible to sterilize a dead tooth
- It is NOT possible to accurately measure a tooth
- It is NOT possible to completely fill a dead tooth
- It is NOT possible to prevent further infection
- It is NOT possible to prevent all the toxins in the tooth from
- spreading throughout the body

Some Symptoms

“...a high percentage of chronic degenerative diseases
can originate from root filled teeth.

The most frequent were heart and circulatory diseases ...

The next most common diseases were those of the joints, arthritis and rheumatism. In third place - but almost tied for second - were diseases of the brain and nervous system. After that, any disease you can name might (and in some cases has) come from root filled teeth.”
Dr George Meinig

Root Filling Cements

All root filling cements are cytotoxic - they kill cells. Some are neurotoxic and may cause permanent nerve damage. Many contain formaldehyde that is both allergenic and causes cancer. Root filling cements break down releasing many toxic substances - formaldehyde, ammonia, carbon monoxide, carbon dioxide and toxic sodium oxide, amines, calcium tungstate, zirconium oxide, silica, silicone oil.

Whatever is inside a tooth will spread throughout the body

Dead Tissue & Bacteria

The gangrenous breakdown products from the decaying tissue and the anaerobic bacteria which live inside the tooth release thioethers, mercaptans and endotoxins.

Thioethers are strongly related, both in their structure and their effect, to mustard gas and other poison gasses used in the First World War.

It is the vital organs - the liver, nervous system, endocrine glands, and heart - that are primarily affected. Hydrogen sulphide alters transmission within nerve fibres and may have other far reaching and varied effects including headaches, nausea, vomiting, depression, personality changes, nosebleeds, and breathing difficulties - asthmatics are particularly at risk.

How Successful is

Root Canal Therapy?

Dentistry does not consider the effects on your health to be a factor

when judging the success of root treatment.

Successful treatment is regarded as a lack of pain and a good looking x-ray of the tooth.

Root Therapy fails often. Dentistry commonly advises to re-do the root treatment.

“... re-treatment is a relatively common procedure, particularly amongst specialist endodontists. Some endodontists estimate that up to two-thirds of their referrals are for endodontic re-treatment ...”

Australian Dental Association News Bulletin April 1996

WARNING Pulpotomy

This is the process of trying to do a root therapy on a child's 'baby' tooth. The most common procedure is to remove the top of the nerve and place formaldehyde into the tooth. More recently a material called Ferric Sulphate is being used - it can cause permanent liver damage.

This is usually sealed with a filling and covered by a nickel releasing stainless steel crown.

This may have disastrous effects on the child, causing anything from bed wetting to leukemia!

Always remove dead, infected and gangrenous tissue from the body.

Leaving a space may create a TMJ problem which can usually be easily controlled by replacing the missing tooth.

It is much easier to replace a missing tooth than to cure the diseases caused by dead teeth.

***Root Canal Treatment is
the practice of keeping dead,
infected & gangrenous tissue
buried in a gold coffin
deep in the bone
inches away from your brain***
